Welcome to nginx!

If you see this page, the nginx web server is successfully installed and working. Further configuration is required.

For online documentation and support please refer to nginx.org.
Commercial support is available at nginx.com.

Thank you for using nginx.

AWS > Registration Confirmation

Congratulations!

We are activating your account, which should take a few minutes. You will receive an email when this is complete.

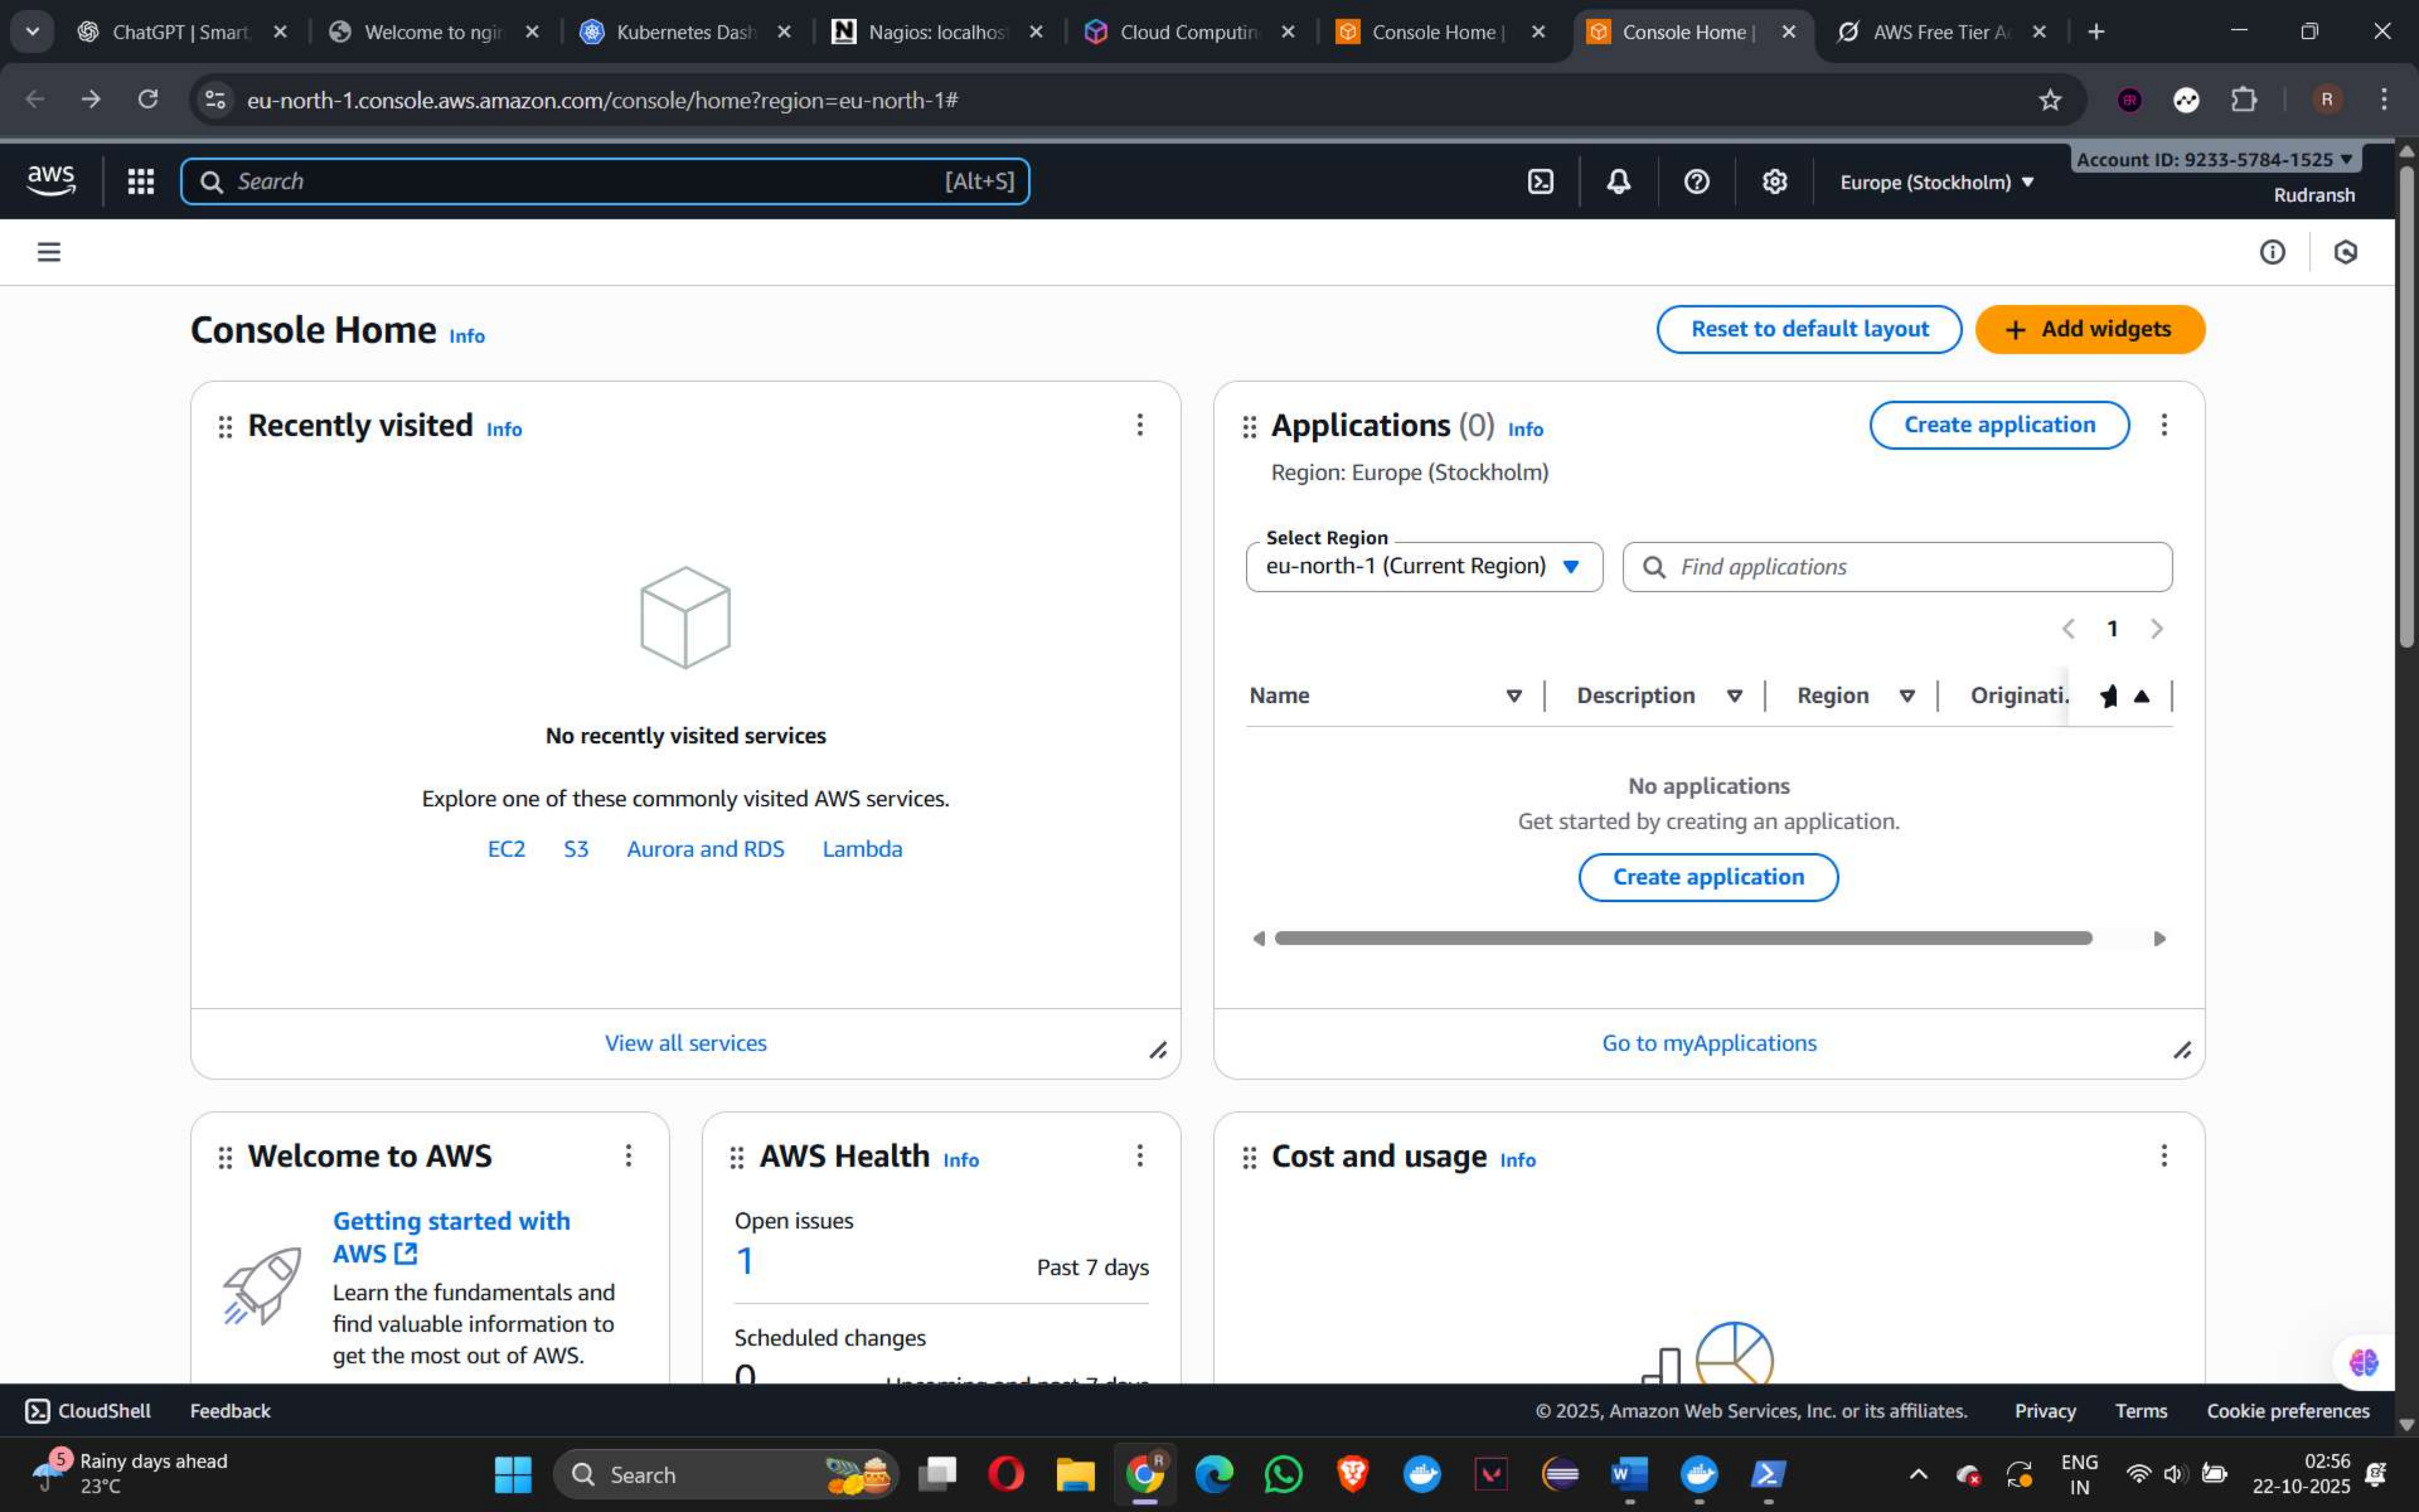

Go to the AWS Management Console

Sign up for another account

Hi, I can connect you with an AWS representative or answer questions you have on AWS.

My role is: [dropdown menu]

Pod keeps restarting repeatedly. What to do?

Run `kubectl describe pod` and `kubectl logs` to check errors. Verify resource limits, image, and probes. Fix YAML and redeploy.

Pod stuck in "Pending" state. Reasons and troubleshooting?

Reasons: Insufficient resources, node affinity/taints, image pull errors, PVC issues, scheduler problems.

Troubleshoot: Use `kubectl describe pod`, check nodes (`kubectl get nodes`), validate image/PVC, fix config, and redeploy.

Debug a failed deployment in Kubernetes?

Run `kubectl get deployment`, `kubectl describe deployment`, `kubectl logs` for pods. Check quotas, YAML, and fix errors. Redeploy.

Deployment with failing health checks. Identify and fix?

Use `kubectl describe pod`, `kubectl logs` to find probe failures. Check resources, app errors, network. Adjust probes/resources in YAML and redeploy.

Roll back a faulty deployment?

Run `kubectl rollout history deployment`, then `kubectl rollout undo deployment` or `--to-revision=<number>`. Verify with `kubectl rollout status`.

Debug a running Pod?

Use `kubectl logs`, `kubectl exec -it -- /bin/sh`, `kubectl top pod`, `kubectl port-forward`. Fix config based on findings.

Expose a local service externally?

Create Service with `kubectl expose deployment --type=LoadBalancer --port=80`. Check external IP with `kubectl get svc`. Ensure security groups allow traffic.

Nagios Questions

Start and stop Nagios?

Start: `sudo systemctl start nagios`. Stop: `sudo systemctl stop nagios`. Verify: `sudo systemctl status nagios`.

Nagios web interface shows “Unable to connect to Nagios process”?

Check service (`sudo systemctl status nagios`), validate config (`nagios -v`), fix permissions, restart web server (`systemctl restart httpd`), allow port 80.

New host not appearing in Nagios web interface?

Verify host config in `hosts.cfg`, check `nagios.cfg` includes, run `nagios -v`, restart Nagios (`systemctl restart nagios`), refresh UI.

Check if Nagios is running properly?

Run `sudo systemctl status nagios`, check `ps aux | grep nagios`, test web interface (`http://<IP>/nagios`), verify logs.

View Nagios logs in real-time?

Run `tail -f /usr/local/nagios/var/nagios.log` or `journalctl -u nagios -f`.

Advantages of using Nagios?

Comprehensive monitoring, customizable plugins, alerting, scalability, open-source, intuitive web interface, extensible with integrations.
